| relevance | <p>This query is a representative of a simple navigational query. It looks for paths of length 1..3 through the knows relation, starting from a given Person and ending at a Person with a given first name. It is interesting for several aspects. (1) It requires for a complex aggregation for returning the concatenation of universities, companies, languages and email information of the Person. (2) It tests the ability of the optimizer to move the evaluation of sub-queries functionally dependant on the Person, after the evaluation of the top-k. (3) Its performance is highly sensitive to properly estimating the cardinalities in each transitive path, and paying attention not to explore already visited Persons.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| | limit | 20 | | | |
| | CPs | 1.1, 2.2, 2.3, 3.2, 8.5 | | | |
| | relevance | <p>This is a navigational query looking for paths of length two, starting from a given Person, going to their friends and from them, moving to their published Posts and Comments. This query exercises both the optimizer and how data is stored. It tests the ability to create execution plans taking advantage of the orderings induced by some operators to avoid performing expensive sorts. This query requires selecting Posts and Comments based on their creation date, which might be correlated with their identifier and therefore, having intermediate results with interesting orders. Also, messages could be stored in an order correlated with their creation date to improve data access locality. Finally, as many of the attributes required in the projection are not needed for the execution of the query, it is expected that the query optimizer will move the projection to the end.</p> | | | |

| CPs | 2.1, 3.1, 5.1, 8.2, 8.5 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| relevance | This query looks for paths of length two and three, starting from a Person, going to friends or friends of friends, and then moving to Messages. This query tests the ability of the query optimizer to select the most efficient join ordering, which will depend on the cardinalities of the intermediate results. Many friends of friends can be duplicate, then it is expected to eliminate duplicates and those people prior to access the Post and Comments, as well as eliminate those friends from Countries CountryX and CountryY, as the size of the intermediate results can be severely affected. A possible structural optimization could be to materialize the number of Posts and Comments created by a Person, and progressively filter those people that could not even fall in the top 20 even having all their posts in the Countries CountryX and CountryY. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|-----------|--|---|----------------|---|---|
| query | Interactive / complex / 7 | | | | |
| title | Recent likers | | | | |
| pattern | | | | | |
| desc. | <p>Given a start Person, find the most recent likes on any of start Person's Messages. Find Persons that liked (likes edge) any of start Person's Messages, the Messages they liked most recently, the creation date of that like, and the latency in minutes (minutesLatency) between creation of Messages and like. Additionally, for each Person found return a flag indicating (isNew) whether the liker is a friend of start Person. In case that a Person liked multiple Messages at the same time, return the Message with lowest identifier.</p> | | | | |
| params | 1 | personId | ID | | |
| result | 1 | friend.id | ID | R | |
| | 2 | friend.firstName | String | R | |
| | 3 | friend.lastName | String | R | |
| | 4 | likes.creationDate | DateTime | R | |
| | 5 | message.id | ID | R | |
| | 6 | message.content or message.imageFile (for photos) | Text | R | |
| | 7 | minutesLatency | 32-bit Integer | C | Duration between creation of the Message and the creation of the like, in minutes |
| | 8 | isNew | Boolean | C | False if person and friend know each other, True otherwise |
| sort | 1 | likes.creationDate | ↓ | | |
| | 2 | friend.id | ↑ | | |
| limit | 20 | | | | |
| CPs | 2.2, 2.3, 3.3, 5.1, 8.1, 8.3 | | | | |
| relevance | <p>This query looks for paths of length two, starting from a given Person, moving to its published messages and then to Persons who liked them. It tests several aspects related to join optimization, both at query optimization plan level and execution engine level. On the one hand, many of the columns needed for the projection are only needed in the last stages of the query, so the optimizer is expected to delay the projection until the end. This query implies accessing two-hop data, and as a consequence, index accesses are expected to be scattered. We expect to observe variate cardinalities, depending on the characteristics of the input parameter, so properly selecting the join operators will be crucial. This query has a lot of correlated sub-queries, so it is testing the ability to flatten the query execution plans.</p> | | | | |

IC 13
IC 14

Interactive / complex / 8

| | | | | | |
|-------|-----------|---|-------------------------|----------|---|
| IC 1 | query | Interactive / complex / 8 | | | |
| IC 2 | title | Recent replies | | | |
| IC 3 | pattern |  <pre> graph TD P[person: Person] -- hasCreator --> M[Message] M -- replyOf --> C[comment: Comment] C -- hasCreator --> CA[commentAuthor: Person] P -- id = \$personId --> P CA -- id, firstName, lastName --> CA C -- id, content, creationDate --> C </pre> | | | |
| IC 4 | desc. | Given a start Person, find the most recent Comments that are replies to Messages of the start Person. Only consider direct (single-hop) replies, not the transitive (multi-hop) ones. Return the reply Comments, and the Person that created each reply Comment. | | | |
| IC 5 | params | 1 | personId | ID | |
| IC 6 | result | 1 | commentAuthor.id | ID | R |
| IC 7 | | 2 | commentAuthor.firstName | String | R |
| IC 8 | | 3 | commentAuthor.lastName | String | R |
| IC 9 | | 4 | comment.creationDate | DateTime | R |
| IC 10 | | 5 | comment.id | ID | R |
| IC 11 | | 6 | comment.content | Text | R |
| IC 12 | sort | 1 | comment.creationDate | ↓ | |
| IC 13 | | 2 | comment.id | ↑ | |
| IC 14 | limit | 20 | | | |
| | CPs | 2.4, 3.3, 5.3 | | | |
| | relevance | This query looks for paths of length two, starting from a given Person, going through its created Messages and finishing at their replies. In this query there is temporal locality between the replies being accessed. Thus the top-k order by this can interact with the selection, i.e. do not consider older Posts than the 20th oldest seen so far. | | | |

Interactive / complex / 9

| | | | | | |
|-------|-----------|--|---|----------|---|
| IC 1 | query | Interactive / complex / 9 | | | |
| IC 2 | title | Recent messages by friends or friends of friends | | | |
| IC 3 | pattern | <pre> graph LR person["person: Person id = \$personId"] -- "knows*1..2" --- otherPerson["otherPerson: Person id firstName lastName"] otherPerson -- "hasCreator" --- message["message: Message creationDate < \$maxDate id content / imageFile creationDate"] </pre> | | | |
| IC 4 | | | | | |
| IC 5 | | | | | |
| IC 6 | | | | | |
| IC 7 | | | | | |
| IC 8 | | | | | |
| IC 9 | | | | | |
| IC 10 | | | | | |
| IC 11 | | | | | |
| IC 12 | desc. | Given a start Person, find the most recent Messages created by that Person's friends or friends of friends (excluding start Person). Only consider Messages created before the given maxDate (excluding that day). | | | |
| IC 13 | params | 1 | personId | ID | |
| IC 14 | | 2 | maxDate | Date | |
| | result | 1 | otherPerson.id | ID | R |
| | | 2 | otherPerson.firstName | String | R |
| | | 3 | otherPerson.lastName | String | R |
| | | 4 | message.id | ID | R |
| | | 5 | message.content or message.imageFile (for photos) | Text | R |
| | | 6 | message.creationDate | DateTime | R |
| | sort | 1 | message.creationDate | ↓ | |
| | | 2 | message.id | ↑ | |
| | limit | 20 | | | |
| | CPs | 1.1, 1.2, 2.2, 2.3, 3.2, 3.3, 8.5 | | | |
| | relevance | This query looks for paths of length two or three, starting from a given Person, moving to its friends and friends of friends, and ending at their created Messages. This is one of the most complex queries, as the list of choke points indicates. This query is expected to touch variable amounts of data with entities of different characteristics, and therefore, properly estimating cardinalities and selecting the proper operators will be crucial. | | | |

|-----------|--|---|--|--|--|
| query | Interactive / complex / 10 | | | | |
| title | Friend recommendation | | | | |
| pattern | <div><div><div><div>person: Person</div><div><code>id = \$personId</code></div></div><div>knows*2..2</div><div><div>foaf: Person</div><div><code>(month(birthday) = \$month and day(birthday) ≥ 21) or (month(birthday) = \$month+1 and day(birthday) < 22)</code></div><div>id firstName lastName gender</div></div><div>isLocatedIn</div><div><div>city: City</div><div>name</div></div></div><div><div><div>common</div><div><div><div>person: Person</div><div>hasInterest</div><div>Tag</div></div><div><div>foaf: Person</div><div>hasCreator</div><div><div>count</div><div>Post</div></div><div>hasTag</div></div></div></div><div><div>uncommon</div><div><div><div>person: Person</div><div>«neg» hasInterest</div><div>Tag</div></div><div><div>foaf: Person</div><div>hasCreator</div><div><div>count</div><div>Post</div></div><div>hasTag</div></div></div></div></div></div> | | | | |
| desc. | <p>Given a start Person with id <code>personId</code>, find that Person’s friends of friends (<code>foaf</code>) – excluding the start Person and his/her immediate friends –, who were born on or after the 21st of a given month (in any year) and before the 22nd of the following month. Calculate the similarity between each friend and the start person, where <code>commonInterestScore</code> is defined as follows:</p> <ul style="list-style-type: none">• <code>common</code> = number of Posts created by friend, such that the Post has a Tag that the start person is interested in• <code>uncommon</code> = number of Posts created by friend, such that the Post has no Tag that the start person is interested in• <code>commonInterestScore</code> = <code>common</code> - <code>uncommon</code> | | | | |
| params | <div><div>1</div><div>personId</div><div>ID</div></div> <div><div>2</div><div>month</div><div>32-bit Integer</div></div> | <div>Between 1 and 12. Implementations may also pass the next month as an additional <code>nextMonth</code> parameter</div> | | | |
| result | <div><div>1</div><div>foaf.id</div><div>ID</div><div>R</div></div> <div><div>2</div><div>foaf.firstName</div><div>String</div><div>R</div></div> <div><div>3</div><div>foaf.lastName</div><div>String</div><div>R</div></div> <div><div>4</div><div>commonInterestScore</div><div>32-bit Integer</div><div>A</div></div> <div><div>5</div><div>foaf.gender</div><div>String</div><div>R</div></div> <div><div>6</div><div>city.name</div><div>String</div><div>R</div></div> | | | | |
| sort | <div><div>1</div><div>commonInterestScore</div><div>↓</div></div> <div><div>2</div><div>foaf.id</div><div>↑</div></div> | | | | |
| limit | 10 | | | | |
| CPs | 2.3, 3.3, 4.1, 4.2, 5.1, 5.2, 6.1, 7.1, 8.6 | | | | |
| relevance | <p>This query looks for paths of length two, starting from a Person and ending at the friends of their friends. It does widely scattered graph traversal, and one expects no locality of in friends of friends, as these have been acquired over a long time and have widely scattered identifiers. The join order is simple but one must see that the anti-join for “not in my friends” is better with hash. Also the last pattern in the scalar sub-queries joining or anti-joining the Tags of the candidate’s Posts to interests of self should be by hash.</p> | | | | |

Interactive / complex / 11

| | | | | | |
|-------|-----------|---|-----------------------|----------------|---|
| IC 1 | query | Interactive / complex / 11 | | | |
| IC 2 | title | Job referral | | | |
| IC 3 | pattern |  <pre> graph TD person[person: Person] -- "knows*1..2" --> otherPerson[otherPerson: Person] otherPerson -- "workAt year(workFrom) < \$year" --> company[company: Company] company -- "isLocatedIn" --> country[country: Country] </pre> | | | |
| IC 4 | | | | | |
| IC 5 | | | | | |
| IC 6 | | | | | |
| IC 7 | | | | | |
| IC 8 | | | | | |
| IC 9 | | | | | |
| IC 10 | desc. | Given a start Person, find that Person's friends and friends of friends (excluding start Person) who started working in some Company in a given Country, before a given date (year). | | | |
| IC 11 | params | 1 | personId | ID | |
| IC 12 | | 2 | countryName | String | |
| IC 13 | | 3 | workFromYear | 32-bit Integer | |
| IC 14 | result | 1 | otherPerson.id | ID | R |
