BI 14	desc.	<p>Consider all pairs of people (person1, person2) such that one is located in a City of Country country1 and the other is located in a City of Country country2. For each City of Country country1, return the highest scoring pair. The score of a pair is defined as the sum of the subscores awarded for the following kinds of interaction. The initial value is score = 0.</p> <ol style="list-style-type: none"> <li>1. person1 has created a reply Comment to at least one Message by person2: score += 4</li> <li>2. person1 has created at least one Message that person2 has created a reply to: score += 1</li> <li>3. person1 and person2 know each other: score += 15</li> <li>4. person1 liked at least one Message by person2: score += 10</li> <li>5. person1 has created at least one Message that was liked by person2: score += 1</li> </ol> <p>Consequently, the maximum score a pair can obtain is: 4 + 1 + 15 + 10 + 1 = 31.</p> <p>This query has two variants based on whether the input parameters are selected as correlated (close countries) or uncorrelated (far countries).</p>
