query	Interactive / complex / 1																																																																					
title	Transitive friends with certain name																																																																					
pattern	<pre>graph LR P1[person: Person id = \$personId] -- knows*1..3 --> P2[otherPerson: Person firstName = \$firstName id lastName birthday creationDate gender browserUsed locationIP email speaks] P2 -- isLocatedIn --> LC[locationCity: City name] P2 -- «opt» workAt --> C[company: Company name] P2 -- «opt» studyAt --> U[university: University name] C -- isLocatedIn --> CC[companyCountry: Country name] U -- isLocatedIn --> UC[universityCity: City name]</pre>																																																																					
desc.	Given a start Person, find Persons with a given first name (firstName) that the start Person is connected to (excluding start Person) by at most 3 steps via the knows relationships. Return Persons, including the distance (1..3), summaries of the Persons workplaces and places of study.

relevance	This query is a representative of a simple navigational query. It looks for paths of length 1..3 through the knows relation, starting from a given Person and ending at a Person with a given first name. It is interesting for several aspects. (1) It requires for a complex aggregation for returning the concatenation of universities, companies, languages and email information of the Person. (2) It tests the ability of the optimizer to move the evaluation of sub-queries functionally dependant on the Person, after the evaluation of the top-k. (3) Its performance is highly sensitive to properly estimating the cardinalities in each transitive path, and paying attention not to explore already visited Persons.
