	desc.	Given two Cities city1, city2, find Persons person1, person2 living in these Cities (respectively) with the shortest <i>interaction path</i> between them. If there are multiple pairs of people with shortest paths having the same total weight, return all of them. The shortest path is computed using a weight between two Persons defined as the reciprocal of the number of interactions (direct reply Comments to a Message by the other Person). Therefore, more interactions imply a smaller weight. <i>Note:</i> Interactions are counted both ways, i.e. if Alice writes 2 reply Comments to Bob's Messages and Bob writes 3 reply Comments to Alice's Messages, their total number of interactions is 5.
	params	1 city1Id ID Small Cities within the same Country are selected 2 city2Id ID
	result	1 person1.id ID R 2 person2.id ID R 3 totalWeight 64-bit Float C
	sort	1 totalWeight ↑ 2 person1.id ↑ 3 person2.id ↑
	limit	20
	CPs	3.3, 7.6, 7.7, 8.4, 8.6
	relevance	Finding shortest paths between pairs of Persons in Cities can be implemented in theory with an <i>all-pairs shortest</i> paths algorithm. However, this needs to be executed on the whole Person-knows-Person graph (with edge weights derived from the number of interactions) so it is expected to be prohibitively expensive. A better approach is using multiple <i>single-source shortest path algorithms</i> (e.g. from the City with fewer inhibitants).
