BI 2	title	Interaction path between cities
BI 3 BI 4 BI 5 BI 6 BI 7 BI 8 BI 9 BI 10 BI 11	pattern	Find the shortest paths between all pairs of Persons in city1 and city2  city1: City  id = \$city2id  isLocatedIn  compute weighted shortest paths on person1: Person  knows.weight person2: Person  Case i1: Reply from personA to Person B's Message  personA: Person  hasCreator  c: Comment
BI 13 BI 14 BI 15 BI 16 BI 17 BI 18 BI 19 BI 20	desc.	Given two Cities city1, city2, find Persons person1, person2 living in these Cities (respectively) with the shortest <i>interaction path</i> between them. If there are multiple pairs of people with shortest paths having the same total weight, return all of them.  The shortest path is computed using a weight between two Persons defined as the reciprocal of the number of interactions (direct reply Comments to a Message by the other Person). Therefore, more interactions imply a smaller weight. <i>Note:</i> Interactions are counted both ways, i.e. if Alice writes 2 reply Comments to Bob's Messages and Bob writes 3 reply Comments to Alice's Messages, their total number of interactions is 5.
	params	1 city1Id ID Small Cities within the same Country are selected 2 city2Id ID
	result	1         person1.id         ID         R           2         person2.id         ID         R           3         totalWeight         64-bit Float         C
	sort	1 totalWeight ↓ 2 person1.id ↑ 3 person2.id ↑
	limit	20
	CPs	3.3, 7.6, 7.7, 8.4, 8.6
	relevance	Finding shortest paths between pairs of Persons in Cities can be implemented in theory with an <i>all-pairs shortest paths</i> algorithm. However, this needs to be executed on the whole Person-knows-Person graph (with edge weights derived from the number of interactions) so it is expected to be prohibitively expensive. A better approach is using multiple <i>single-source shortest path algorithms</i> (e.g. from the City with fewer inhibitants).
