BI 20 1	desc.	Consider all pairs of people (person1, person2) such that one is located in a City of Country country1 and the other is located in a City of Country country2. For each City of Country country1, return the highest scoring pair. The score of a pair is defined as the sum of the subscores awarded for the following kinds of interaction. The initial value is score = 0.  1. person1 has created a reply Comment to at least one Message by person2: score += 4 2. person1 has created at least one Message that person2 has created a reply to: score += 1 3. person1 and person2 know each other: score += 15 4. person1 liked at least one Message by person2: score += 10 5. person1 has created at least one Message that was liked by person2: score += 1 Consequently, the maximum score a pair can obtain is: 4 + 1 + 15 + 10 + 1 = 31. This query has two variants based on whether the input parameters are selected as correlated (close countries) or uncorrelated (far countries).
	params	1 country1 Long String  A: correlated with parameter country2, i.e. the countries are close and there are many Persons visiting both Countries.  B: uncorrelated with parameter country2, i.e. the countries are afar and there are few Persons visiting both Countries.  2 country2 Long String
